

## 24 hour urine collection for Metanephrines

The measurement of urinary metanephrines is a frequently used test in determining the cause of symptoms such as high blood pressure and sweating. The test involves the collection of all the urine that a patient passes in a 24hr period into a collection bottle containing a preservative.

### Why might I be undertaking this test?

Your doctor may be asking you to undertake this test to determine the cause of symptoms such as high blood pressure and sweating, or to investigate possible disorders of the adrenal gland, a small gland near the kidneys that secretes hormones such as adrenaline. If you have any queries regarding the test please speak to your doctor or contact the Clinical Biochemistry department (details below).

### What does the test involve?

The test involves collecting urine for a 24hr period into a bottle containing an acid preservative. The laboratory will then measure substances called metanephrines, which are products formed from the breakdown of hormones such as adrenaline.

### How do I collect the urine?

You will have been given a 5 litre collection bottle containing an acid preservative (please note, this preservative should be handled with care, see below). Urine should be collected as follows:

- **Do not pass urine directly into the collection bottle**, use another clean container and pour the urine into the 5 litre collection bottle
- Please write your full name and date of birth on the collection bottle
- Start the collection at a specific time, first thing in the morning is usually most convenient. Note the start date and time on the collection bottle
- At the start time, discard the first urine passed (do not save for collection)
- Collect all urine passed in the next 24 hours
- Note the finish date and time of the collection on the bottle

### How do I store the urine once collected?

Store the urine in a cool place once collected, away from food or drink. The collection should be returned as soon as possible to avoid it being spoilt.

### Where do I take the collection?

Return the collection to your doctor's surgery or hospital who will ensure it is sent to the laboratory. Please ensure that:

- You have completed your name, date of birth and the dates/times of the collection period on the bottle

- The request form from your doctor must accompany the collection. If your doctor has not given you a request form, please obtain one before starting the collection

**What happens if I don't complete the information on the collection bottle, or don't send an accompanying request form?**

This could cause significant delays in the processing of your sample, and you may be asked to repeat the collection, so please follow the instructions above.

**When will the results be available?**

Your doctor will be issued with a report of your results. This will take up to two weeks.

**Further Information**

**DANGER:** The bottle(s) provided contain strong acid as a preservative. Contact with skin or eyes must be avoided. In case of accidental contact, wash immediately with plenty of water and, if in doubt, seek medical advice. Keep out of reach of children.

**Dietary Requirements:** You are advised to abstain from eating spicy foods for several days prior to sample collection due to the presence of Capsaicin.

**Medicines:** some drugs interfere with the test. Please record all your pills and medicines below and return this form with the collection.
